```
# Assignment: ASSIGNMENT 2
# Name: Torres, Gloria
# Date: 2023-03-26

## Check your current working directory using `getwd()`
path_cwd <-getwd ()
path_cwd

## List the contents of the working directory with the `dir()` function
dir(path_cwd)
## If the current directory does not contain the `data` directory, set the
## working directory to project root folder (the folder should contain the `data`
directory
## Use `setwd()` if needed

## Load the file `data/tidynomicon/person.csv` to `person_df1` using `read.csv`
## Examine the structure of `person_df1` using `str()`
person_df1 <- read.csv("https://github.com/bellevue-
university/dsc520/blob/master/data/tidynomicon/person.csv")
str(person_df1)
## R interpreted names as factors, which is not the behavior we want
## Load the same file to person_df2 using `read.csv` and setting `stringsAsFactors` to
`FALSE`
## Examine the structure of `person_df2` using `str()`
person_df2 <- read.csv("https://github.com/bellevue-
university/dsc520/blob/master/data/tidynomicon/person.csv", header = TRUE,
stringsAsFactors = FALSE)
str(person_df2)

## Read the file `data/scores.csv` to `scores_df`
## Display summary statistics using the `summary()` function
scores_df <- read.csv("https://github.com/bellevue-
university/dsc520/blob/master/data/scores.csv")
summary(scores_df)

## Load the `readxl` library
library(readxl)

## Using the excel_sheets() function from the `readxl` package,
## list the worksheets from the file `data/G04ResultsDetail2004-11-02.xls`
excel_sheets(readxl_example("https://github.com/bellevue-
university/dsc520/blob/master/data/G04ResultsDetail2004-11-02.xls"))
str(excel_sheets)

## Using the `read_excel` function, read the Voter Turnout sheet
## from the `data/G04ResultsDetail2004-11-02.xls`
## Assign the data to the `voter_turnout_df1`
## The header is in the second row, so make sure to skip the first row
## Examine the structure of `voter_turnout_df1` using `str()`

voter_turnout_df1 <- read_excel("https://github.com/bellevue-
university/dsc520/blob/master/data/G04ResultsDetail2004-11-02.xls", sheet = "Sheet0", skip
= 1, col_names = TRUE)
str(voter_turnout_df1)

## Using the `read_excel()` function, read the Voter Turnout sheet
## from `data/G04ResultsDetail2004-11-02.xls`
## Skip the first two rows and manually assign the columns using `col_names`
## Use the names "ward_precint", "ballots_cast", "registered_voters", "voter_turnout"
## Assign the data to the `voter_turnout_df2`
## Examine the structure of `voter_turnout_df2` using `str()`
voter_turnout_df2 <- read_excel("https://github.com/bellevue-
university/dsc520/blob/master/data/G04ResultsDetail2004-11-02.xls",sheet = "Sheet0", skip
```

```
= 2, col_names = TRUE)
str(voter_turnout_df2)

## Load the `DBI` library
library(DBI)

## Create a database connection to `data/tidynomicon/example.db` using the dbConnect()
function
## The first argument is the database driver which in this case is `RSQLite::SQLite()`
## The second argument is the path to the database file
## Assign the connection to `db` variable
db <- dbConnect(RSQLite::SQLite(), "data/tidynomicon/example.db")

## Query the Person table using the `dbGetQuery` function and the
## `SELECT * FROM PERSON;` SQL statement
## Assign the result to the `person_df` variable
## Use `head()` to look at the first few rows of the `person_df` dataframe
person_df <- dbGetQuery(con, "SELECT * FROM person;", FALSE)
head(person_df)

## List the tables using the `dbListTables()` function
## Assign the result to the `table_names` variable
table_names <- dbListTables(con)

## Read all of the tables at once using the `lapply` function and assign the result to the
`tables` variable
## Use `table_names`, `dbReadTable`, and `conn = db` as arguments
## Print out the tables
tables <- lapply(dbReadTable, conn = db)
tables

## Use the `dbDisconnect` function to disconnect from the database
dbDisconnect()

## Import the `jsonlite` library
library(jsonlite)

## Convert the scores_df dataframe to JSON using the `toJSON()` function
toJSON(scores_df)
## Convert the scores dataframe to JSON using the `toJSON()` function with the
`pretty=TRUE` option

toJSON(scores_df, pretty = TRUE)
```
